EXPERIENCE

Senior Software Engineer at Vector.co — Boston, MA

April 2025 – Present

- **Designed and built automated data pipeline services** to process **hundreds of millions** of person records for analysis and reporting.
- **Designed and implemented a signals processing engine** for real-time event-driven ingestion, leveraging **Inngest**.
- Leveraged IAC practices to manage AWS infrastructure for those pipelines and backend services via **Terraform**, with **CI/CD pipelines in GitHub Actions**.
- **Monitored production pipelines and services via Datadog**, building dashboards and alert policies to catch ingestion failures and latency regressions before customers noticed.
- Built and maintained internal tooling for non-technical staff to **investigate and troubleshoot** customer issues.

Senior Site Reliability Engineer at Klaviyo.com — Boston, MA

March 2024 – March 2025

- **Designed and built incident management software** for on-call engineers, including a Python-based Slack bot for incident coordination and a reporting service for senior leadership to track incident trends
- **Supported hundreds of billions of requests through Black Friday/Cyber Monday with 100% uptime** (\$3B attributable revenue) via infrastructure scaling, organization-wide testing, and a monitoring & alerting posture built out in the months prior
- **Mentored junior engineers** in Python development and infrastructure-as-code best practices
- **Maintained local engineering environment setup** and automation for 300+ engineers across our product teams, ensuring a consistent and efficient development experience

Senior DevOps Engineer at Drift.com — Boston, MA

July 2019 – March 2024

- **Architected and built the team's internal developer platform (IDP)**, a web UI and backend service integrating dozens of internal tools and metrics, shaped by requirements gathered directly from the engineering teams who depended on it daily
- **Led design & development of Slack-driven CI/CD deployment systems** responsible for configuring, deploying, and scaling hundreds of applications daily to both the U.S. & E.U.
- **Reduced build times by 30%** within our largest repositories through efficient dependency management, compiler optimizations, and shared workflows within CircleCI
- **Instituted infrastructure-as-code practices** using Terraform and Helm across dozens of **Kubernetes clusters** and hundreds of services, running on both AWS and Google Cloud in multiple regions — monitored via **Prometheus, Grafana, and the ELK stack**
- **Led incident response, triage, & critical fixes** for cloud infrastructure, CI/CD pipelines, & networking outages as part of a **shared on-call rotation**, often reconstructing failures from logs, metrics, and secondhand reports in environments inaccessible to direct debugging

EDUCATION

B.S. Computer Science, Minor in Mathematics
Dean's List, 3.6 G.P.A.

Northeastern University — Boston, MA
September 2015 – December 2019

TECHNICAL SKILLS

Experienced (4+ Years): Java, Golang, Docker, Kubernetes, Terraform, AWS, Linux, CI/CD (CircleCI, GitHub Actions)

Proficient (3 Years): Python (Django, FastAPI), Shell Scripting, SQL, Javascript (React, Node, ES5/6), Typescript

Familiar (1-2 Years): C, C++, Ruby, LaTeX, GNU Make, Nginx

Observability: Prometheus, Grafana, ELK Stack, Datadog
